DAMPING TOOLS 阻尼减振刀具

阻尼减振刀具前言

Damping shock absorber

减振刀具是机械加工行业一颗璀璨的明星，有效解决了长悬伸刀具切削振颤问题，特别是在深孔加工中的减振镗刀应用最为广泛。但一直以来被国外刀具品牌所垄断，国内刀具制造业始终难以望其项背。松德刀具一直致力于打造民族镗刀第一品牌，而对于减振镗刀研发将是一个必须逾越的鸿沟。松德研发团队坚持不懈的致力于减振系统的研究，终于攻克了这一难题！

我们在研发过程中，充分研究了动力减振技术和阻尼减振技术，结合专业知识和经验，研究设计开发出了独特的有阻尼减振系统及其结构形式，有助于精确地将刀具振动的振幅快速减至最低；同时研究了切削振颤控制技术，便于准确地确定不同领域的振动类型，有效地控制这些振动。对于一般的刀杆，在长径比超过4倍时刀具本身将产生振颤，使得加工无法进行。随着悬伸越来越长，刀具刚性会越来越低，切削力会对切削刀具振动的振幅影响也会越来越大。

在刀具切削加工中，振动不可能完全被消除，但是，减振镗刀完全可将其降低至最低水平，使其对加工过程和结果不造成不良的影响。采用先进的模拟方法、测量设备及系统，通过优化刀具结构及各零部件参数，在正常的切削区域内，减振镗刀的减振系统完全可以消除切削力作用在刀具上产生的振动对切削过程的不利影响。

总而言之，松德阻尼减振刀具可以帮助您实现更低的单个零件成本。

Anti-Vibration tool is a future bright star in metal industry which bring an effective solution to the long overhang cutting tool chatter problem, especially in the deep hole processing applications widely. But there has been monopolized by foreign brands knives and domestic knives manufacturing has always been difficult to hold a candle. Sunder-tools has committed to build the first national brand of boring tool, and damping boring tool will be developed to be a insurmountable gap. Study Sunder-tools R & D team unwavering commitment damping system, and finally overcome this problem!

In the development of process, to fully investigate the dynamic vibration damping technology and technology, combined with expertise and experience in research and design has developed a unique damping system EC and its structure, the tool helps precisely to minimize the vibration amplitude fast; also studied cutting flutter control technology to facilitate accurate determination of different areas.

The type of vibration, for general tools effectively control these vibrations in an aspect ratio of more than four times the tool itself will produce vibrations, so that can not be processed. With a growing overhang longer, the tool will become increasingly rigid low cutting forces will affect the amplitude of vibration of the cutting tool will be growing.

In the cutting tool, the vibration can not be completely eliminated, but the damping boring tool can be reduced to the lowest level so that the results of the process and does not cause adverse impact.

Using advanced simulation methods, measuring equipment and systems, by optimizing the structure of the tool parameters and various parts in the normal cutting zone, boring tool vibration damping

The system can eliminate the adverse effects of vibration on the tool cutting forces generated by the cutting process.

DAMPING TOOLS 阻尼减振刀具

选择正确的刀具

Choose the right tool

选择正确的刀具对于获得最佳的生产效率和加工结果至关重要。对每种长度/直径比的加工应用总能提供最佳的解决方案,减振系统在特定工况下仍有上佳表现。

每个减振刀具都有特定的悬伸范围,以实现最佳的刀具性能,确保每种刀具在正确的范围内使用是很重要的。如果短刀具使用加长杆就无法实现预期的加工效果。

提高切削刀具的静态刚度可以帮助提高切屑去除率和生产效率,而不会发生振动问题。选用标准刀具可以使你以最小的长度和最大的直径来装配刀具。两者的参数同等重要。

如果选用模块化刀具,安装时要确保靠近机床侧的直径最大。

工作范围说明

当刀具悬伸为3倍刀具直径及以上时,使用减振刀具可以提高生产效率。

对于刀具悬伸为4倍刀具直径的应用,使用减振刀具,通常可将切削参数提高至少50%;对于刀具悬伸为6倍刀具直径及以上的应用,要实现出色的生产效率、优异的孔质量以及表面质量,减振刀具是唯一的选择。

如果标准产品无法满足您的应用对于长度、直径、接口以及其他规格的要求,我们的订制刀具同样具有最佳性能。

It's essential to choosing the right tool for the best productivity and processing results . For each length / diameter ratio of processing applications always provide the best solution, the damping system is still a good performance in specific conditions. Each tool has a specific damping overhang range, to achieve the best performance tool to ensure that each use of the tool in the correct range is important

If the short tool to use an extension, then it will not be able to achieve the desired processing results.

Increase static stiffness of the cutting tool can help improve chip removal rate and productivity, and the vibration problem does not occur. can use standard tools

Make you a minimum length and maximum diameter of the tool assembly. Both parameters are equally important.

If you use modular tools, the installation should ensure maximum diameter close to the machine

When the tool overhang is more than three times the diameter of the tool and use the tool vibration can improve production efficiency.

For tool overhang is 4 times the tool diameter applications, use vibration tools cutting parameters can generally be increased by at least 50%; the tool overhang is 6 times tool diameter above applications and to achieve excellent productivity and excellent hole quality and surface quality, vibration tool is the only option.

If the standard products do not meet your application for length, diameter, interfaces, and other specifications of requirements, our custom tool also has the best performance

刀尖设置 Tool Nose Set

由于切削过程中刀片受力，刀杆会出现向下偏斜，可使用DEVI中心线设置数值表调整刀片（刀杆）中心高度，以补偿切削中因受力产生的偏斜。

Since the process of cutting insert by force, there will be downward deflection Arbor, DEVI can be used to adjust the insert centerline table of values (Arbor) Center height to compensate for cutting forces generated due to deflection.

为获得最佳刀杆切削性能和加工质量

1. 采用所允许的最大直径刀杆。
2. 正确设置刀杆悬伸比。
3. 保证使用开槽抱紧方式夹持刀杆。
4. 使用正前角、后角刀片。
5. 使用刀尖半径小且和带有断屑结构的刀片。
6. 正确设置刀片高度。
7. 使切削厚度低于标准切削厚度的20%到50%。
8. 使进给速度高于标准进给速度的10%到50%。
9. 使主轴转速高于标准主轴转速的10%到30%。
10. 通过综合调整主轴转速、切削厚度、进给速度、刀片形状和断屑结构，以使产生较小的切屑。
11. 如果不能及时排出切屑，则可能破坏已加工表面质量、刀片切削刃和刀杆。
12. 使用高压切削液、气以便及时排出切屑。
13. 刀杆减振性能下降时，建议维修保养。

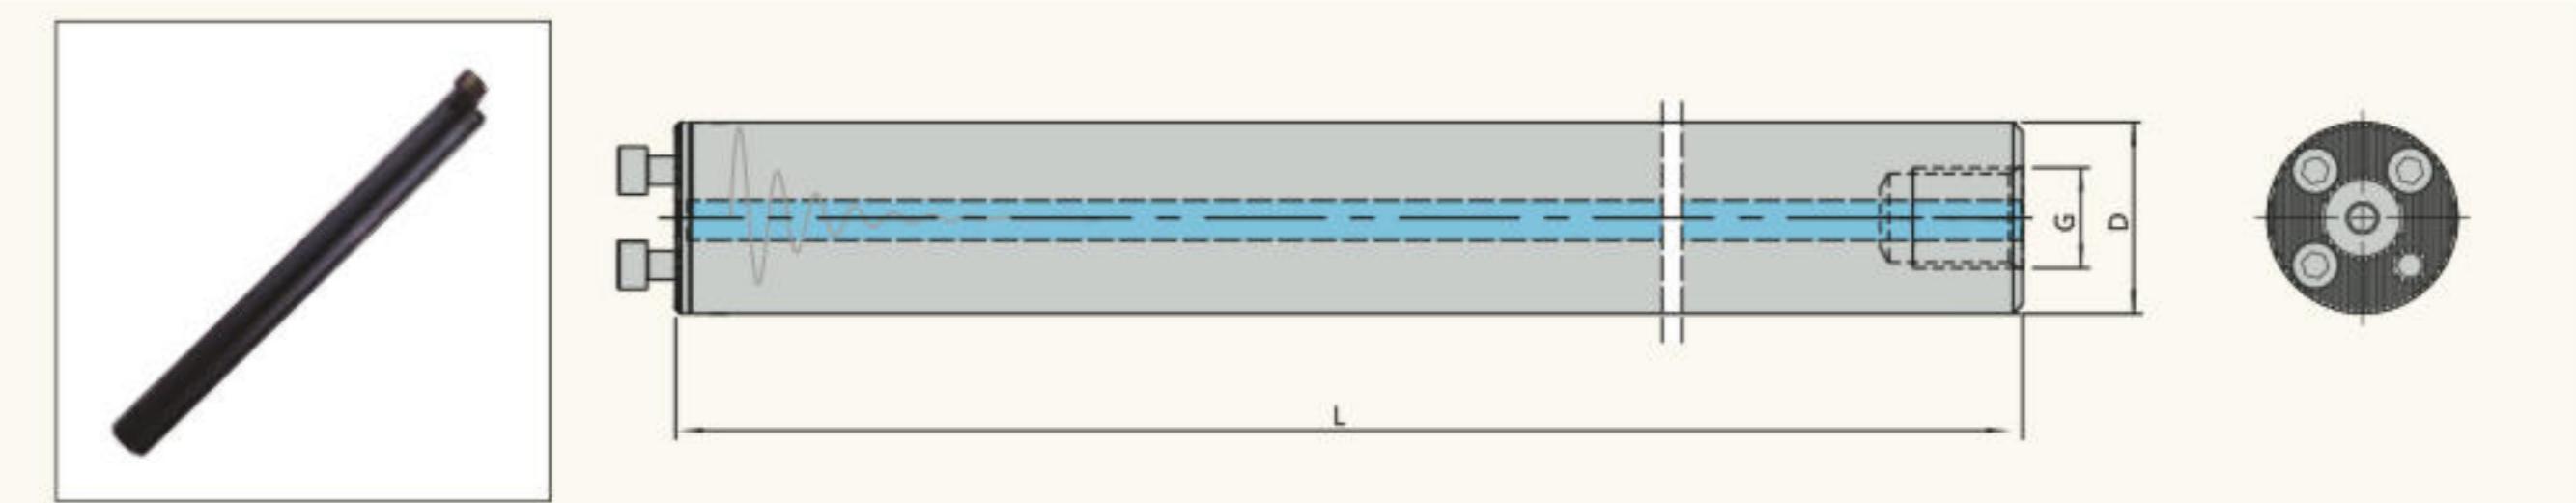

For optimum processing quality and performance

1. Using the maximum diameter shank.
2. The correct settings of overhang ratio.
3. To ensure use the way of "slotted surrounded" clamping holder.
4. Use positive rake angle, back angle insert.
5. Use the small nose radius insert and with chip breaking structure.
6. Set the correct height.
7. The cutting thickness is lower 20% to 50% of the standard thickness.
8. the feed rate higher than the standard feed rate of 10% to 50%.
9. The spindle rate is higher 10% to 30% of the standard
10. The comprehensive adjustment spindle, cutting depth, feed rate, Insert shape and structure, so as to produce smaller chips.
11. If the chip can not be discharged, it may damage the machined Surface quality, cutting edge and holders.
12. The use of high pressure coolant to break chips.
13. when the anti-vibration performance is not good, re-tuning Arbor.

- 推荐最小夹紧长度为4xD。

- Suggested min. length is 4xD.
- Make sure the min. and max. overhanging, otherwise it cannot realize the damping capacity.

DAMPING TOOLS 阻尼减振刀具

阻尼减振铣刀柄

Damping Milling Cutter

主要考虑因素

使用旋转刀具加工不同于车削,在车削时,镗杆夹持在刚性的刀座上,

但是车铣加工中减振杆工作的原理在很大程度上相通的:

- 刚性夹紧
- 尽可能短的刀具长度
- 尽可能大的总成直径
- 铣刀体的重量尽量轻,使抵抗切削力的阻尼系统充分工作

Major Consideration

Rotating tools are different from the turning tools, and the boring bar is clamped by the rigidity cartridge when turning machining. But the anti-vibration principle is almost same when turning and milling machining. Please see below points:

- Rigid clamping
- The shortest effective length
- The largest total diameter
- Lighter weight to be sure damping system works smoothly

降低振动

工件安装和机床稳定性是将振动减至最低需要仔细考虑的两项重要因素。

工件

- 以最佳的方式固定工件,让工装来承受加工过程中产生的切削力。
- 通过铣削刀具设计和主偏角选择能够使得切削力主要作用在工件夹持最稳定的方向上。
- 优化加工策略和方向,以尽可能实现最稳定的切削工况。

机床

- 机床状况会对切削振动产生巨大的影响。主轴轴承或进给装置的过度磨损会导致不良的加工特性。

Lower Down the Vibration

The mounted workpiece and stability of machine tool are the main important facts which can lower down much vibration.

Workpiece

- Mount the workpiece in the best way, then it will take some cutting force when machining.
- It will make sure that the cutting force will work for the most stable direction by two ways which are milling cutter design and selection of approach angle.
- To optimize the processing strategy and direction, then to meet the most stable cutting condition.

Machine Tools

- The condition of machine tool will affect the vibration situation greatly. The excessive wear of spindle bearing and work feeder can result in the poor processing characters.

DAMPING TOOLS 阻尼减振刀具

阻尼减振铣刀柄

Damping Milling Cutter

影响振动的因素

有4种基本因素会对振动产生主要影响:

- 刀具的主偏角会影响切削力作用的方向
- 与径向切深有关的刀具直径
- 刀片槽形
- 刀具齿距

主偏角

主偏角决定了切削力的方向,因此非常重要。主偏角(α)越大,径向切削力就越大。根据工艺和应用场合选择合适刀具。

当径向切削力增加时,可以看出减振刀具与非减振刀具之间在功能方面的差异。

在主偏角较小且悬伸较短的情况下,可在出现振动之前调整刀具的切深甚至可以达到刀片所允许的最大切深。

The Influence Facts of Vibration

There are 4 facts will affect the vibration condition mainly, please see below:

- The approach angle will affect the working direction of the cutting force
- Tool diameter which is relative to the radial cutting depth
- Insert groove
- Pitch

Approach Angle

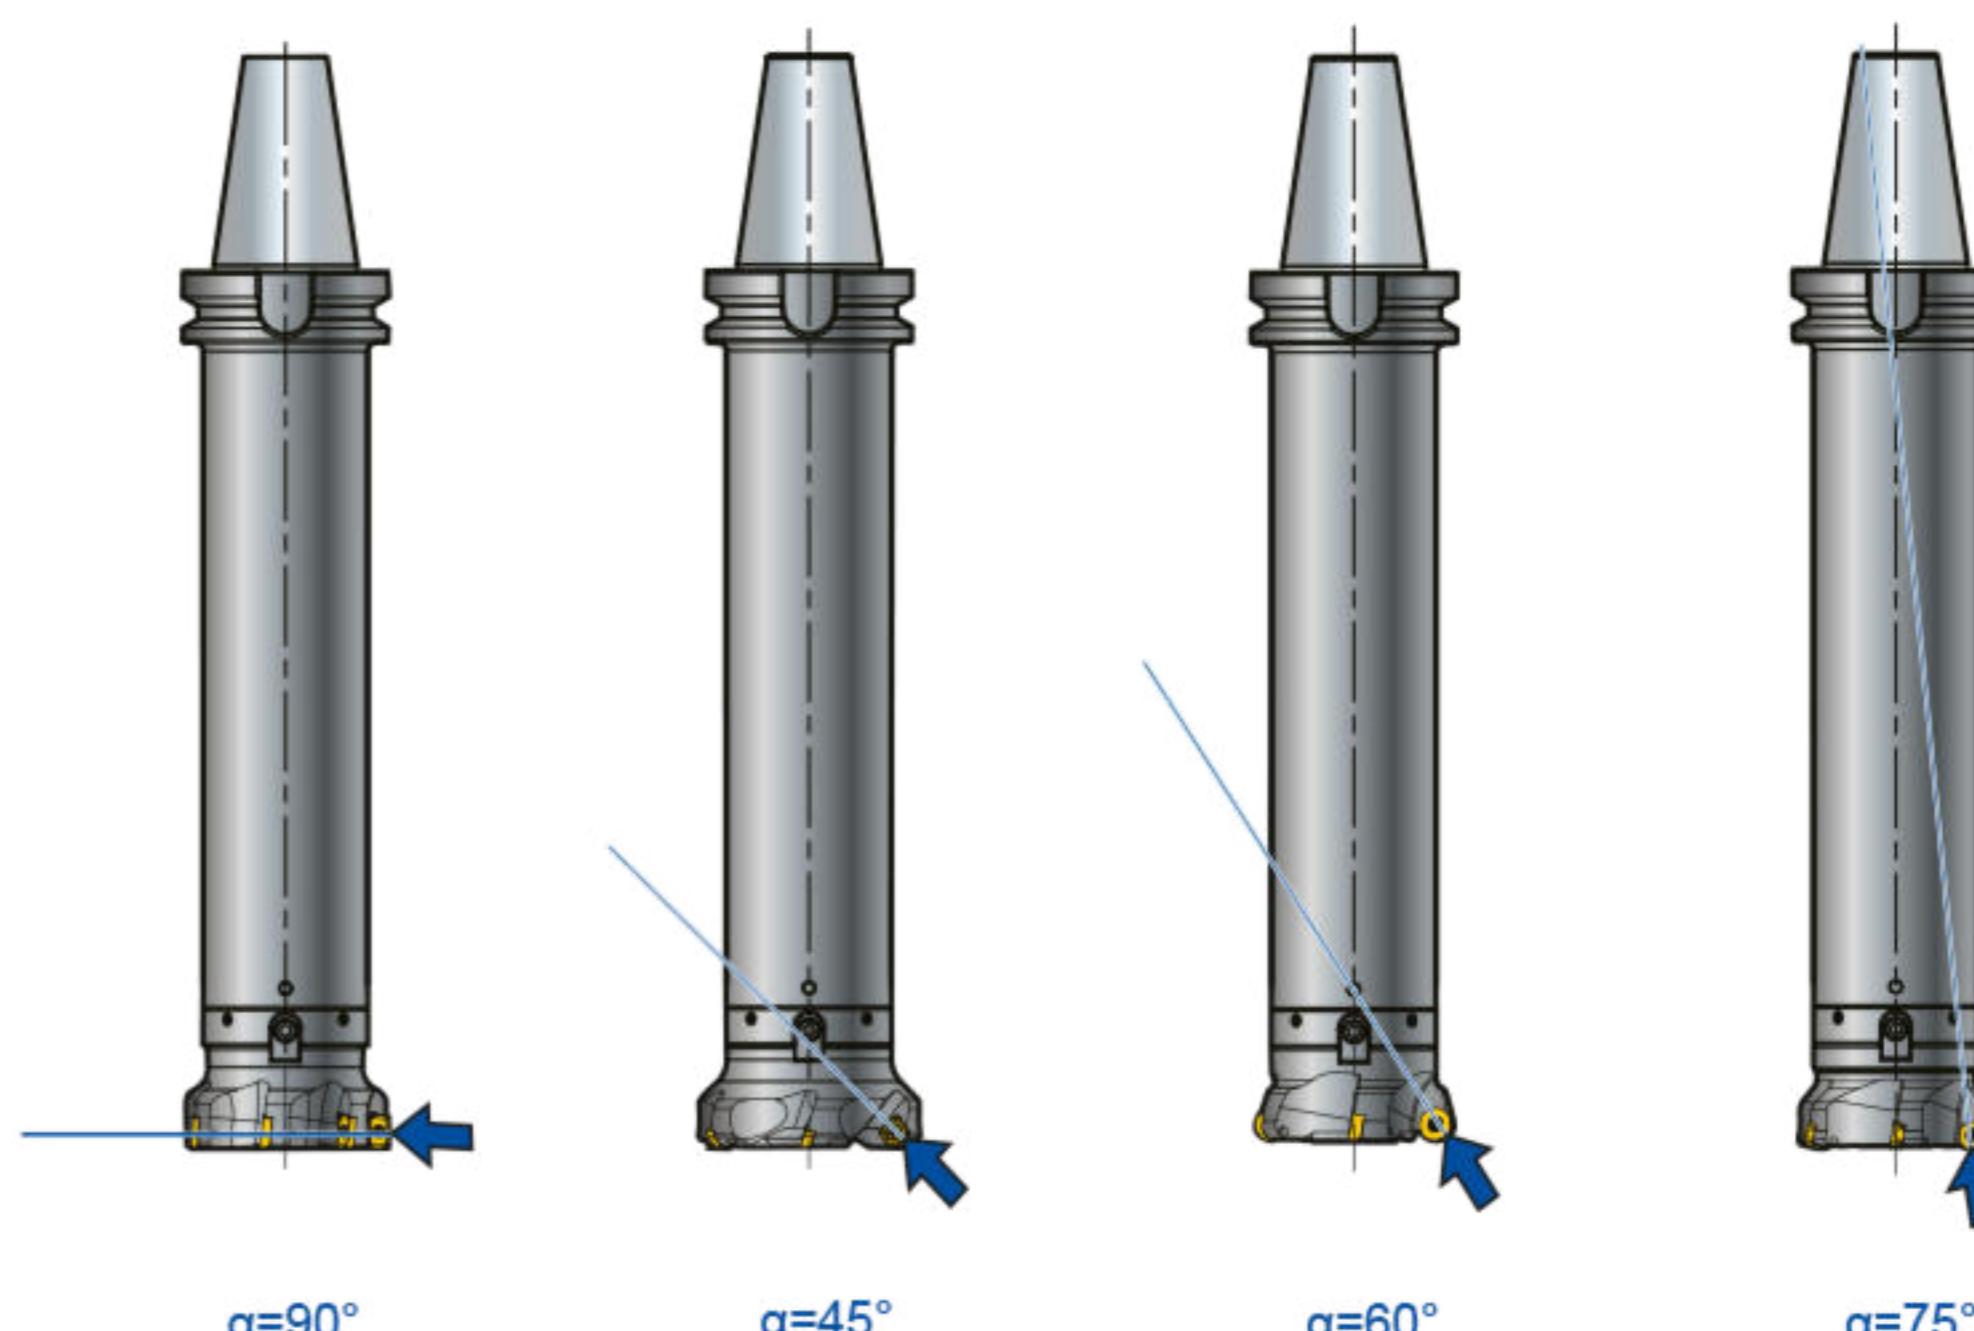

The approach angle decides the direction of cutting force, so it is very important. The approach angle (α) is larger and the radial cutting force is larger. Select the tools according to the technology and working condition.

It will see the differences between damping tools and common tools clearly when the axial cutting force increases.

Under the condition of smaller approach angle and also shorter overhang, we can adjust the cutting depth which will probably meet the deepest depth precedes the vibration situation.

It is suitable for the requirements of large diameter of back boring place but smaller diameter of through hole, which dia. of back boring place is no larger than 2 times dia. of through hole.
There is no need to do the position due to the automatic turnover structure of the tool body.
